Title: Preliminary Proposal to Encode the Tocharian Script

Author: Lee Wilson (ttlwilson@hotmail.com)

Date: 2015-01-26

1 Introduction

Tocharian is a Brahmi-based script historically used to write the Tocharian languages (ISO 639-3: xto, txb), traditionally referred to as Tocharian A and Tocharian B, which belong to the Tocharian branch of the Indo-European language family. The script was in use primarily during the 8th century CE by the people inhabiting the northern edge of the Tarim Basin of the Taklamakan Desert in what is now Xinjiang in western China, an area formerly known as Turkestan.

The Tocharian script is attested in over 4,000 extant manuscripts that were discovered in the early 20th century in the Tarim Basin. The discovery was significant for two reasons: first, it revealed a previously unknown branch of the Indo-European language family, and second, it marked the easternmost geographical extent of that language family.

The most distinctive aspect of Tocharian script is the vowel transcribed as ä, commonly known as the *Fremdvokal*, and the modifications to the script that it entails. This vowel is indicated with a vowel sign not employed in scripts outside of the Tarim Basin region. However, this vowel sign is not commonly used when writing Tocharian. Instead, sequences of a consonant followed by the *Fremdvokal* are most typically indicated by 11 CV signs known as *Fremdzeichen*, which are unique to Tocharian.

2 Background

The Tocharian script is a north-eastern descendant of Brahmi script, related to Khotanese, Tibetan, and Siddham scripts, which was used along the Tarim Basin in the Taklamakan Desert in what is now Xinjiang in western China.

Tocharian script was historically used to write the Tocharian languages (ISO 639-3: xto, txb), traditionally referred to as Tocharian A and Tocharian B, which belong to the Tocharian branch of the Indo-European language family. The script was in use primarily during the 8th century CE by the people inhabiting the northern edge of the Tarim Basin.

Tocharian script is attested in over 4,000 extant manuscripts that were discovered in the early 20th century in the Tarim Basin, primarily in Kucha, Karasahr, and Turfan.

Figure 1: Map showing the locations of Kucha, Karisahr (Qarahisar), Turfan and Dunhuang in what is now the westernmost region of China. (Mladjov)

3 The Issue of Representing Tocharian in Unicode

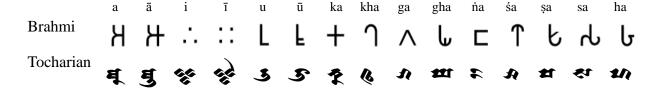

The primary issue facing any proposal to encode Tocharian in the UCS is that of unification with the Brahmi script. While it is true that many sources on Tocharian often refer to its script as "Tocharian Brahmi" or some similar appellation, the Tocharian script nevertheless presents several differences from Brahmi as laid out in the UCS in terms of glyph shapes, character repertoire, and rendering behaviours in particular. With this in mind, there are two main models for representing Tocharian in the UCS:

- 1. Encoding Tocharian as an independent script
- 2. Encoding Tocharian as a subset of Brahmi

3.1 Assessment of the Models for Representing Tocharian

Due to the traditional description of Tocharian script as a variant of Brahmi, their similar character repertoire, and the numerous Sanskrit loanwords found in Tocharian, some may argue that Tocharian is simply a regional variation of Brahmi and is accordingly a candidate for being encoded as a subset of Brahmi. In such a case, the distinctive elements of Tocharian would need to managed at the presentation level through fonts and by encoding characters unique to Tocharian as Brahmi extensions. This approach poses problems, which are outlined below:

• Failure to provide a plain text solution: The Brahmi script as represented in the UCS is based on Aśokan Brahmi from the 3rd century BCE. The first and most obvious issue facing the encoding of Tocharian as a subset of Brahmi is the visual dissimilarity of Tocharian and Brahmi characters. Nearly all characters in Tocharian are considerably different from their Brahmi counterparts, as illustrated in the following selection of letters:

Any reader of Brahmi-encoded Tocharian texts would be required to obtain a Brahmi font with character design based on Tocharian in order to read the texts, and would subsequently be unable to view Aśokan Brahmi texts properly. As a result, considering Tocharian as a subset of Brahmi fails to provide a means for plain text representation of the script.

• Fundamental differences in structure: Tocharian, while descended from Brahmi, employs several structural forms that are not used in Brahmi, such as stacked aksaras and the bar virama, which will be outlined below. As such, Tocharian script cannot be accurately rendered with Brahmi encoding.

Considering these problems, model 1, encoding Tocharian as an independent script, appears to be the best option.

4 Structure

4.1 Introduction

Tocharian script has typically been referred to as a modified form of Brahmi, indicating that people have traditionally considered this script simply to be a form of Brahmi. Although its structure and functionality is indeed clearly within the Brahmic tradition, the Tocharian script is nevertheless significantly different in a number of ways from the Aśokan Brahmi currently encoded, both in terms of glyph shape and orthographic conventions.

As is typical with Brahmic scripts, each letter indicates a consonant followed by the inherent vowel *a* by default. However, unlike scripts such as Devanagari, there is no visual element that is removed when a letter is used in a conjunct. The vowel is silenced either by a subscript conjunct or the *virāma*.

The most obviously different aspect of Tocharian is the use of eleven consonant signs, traditionally referred to as Fremdzeichen, which serve the dual function of representing a consonant plus the vowel \ddot{a} , and to stand in place of the consonant plus virama (the deciding factor of use being the age of the manuscript; later manuscripts do not use Fremdzeichen alone to indicate consonant + virama).

Tocharian also employs unique compounding and virama usage which will be explained below.

4.2 Representative glyphs

The fonts used in this document were created by the author and are based on the documents preserved in the International Dunhuang Project.

4.3 Character Names

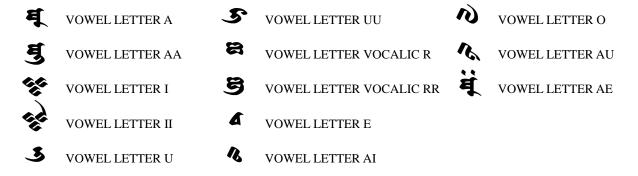

The characters are named in accordance with the UCS convention for Brahmi-based scripts, with the exception of the vowel AE and EI. The rationale for the spelling AE is that the *Fremdvokal* is traditionally transcribed ä, and ae is the typical replacement for ä in 7-bit ASCII contexts.

4.4 Directionality

The script is written from left to right.

4.5 Vowels

There are 13 independent vowel signs:

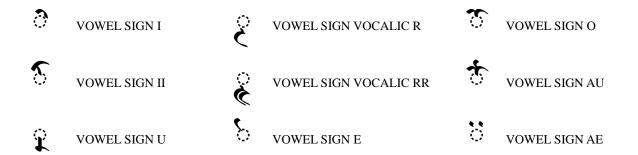

The vowels VOCALIC L and VOCALIC LL are not attested in any Tocharian texts, but spaces have been left available in the code block in case of future discovery.

4.6 Vowel Signs

There are 12 dependent vowel signs:

VOWEL SIGN AE indicates the vowel /i/ (Krause and Slocum, 2014). The transcription <ä> is standard.

4.7 Consonants

There are 44 consonant letters:

*	KA	6	TTA	11	PA	#	SSA	8	WAE
(KHA	•	TTHA	10	РНА	٤ı	SA		SHAE
N	GA	£	DDA	ជ	BA	1/1	НА	Ø	SSAE
##1	GHA	Ia	DDHA	đ	ВНА	8	BA	B	SAE
£	NGA	m	NNA	뒦	MA	•	TAE		
8	CA	*	TA	(11)	YA	Ø	NAE		
æ	СНА	•	THA	I	RA	D	PAE		
8	JA	8	DA	ર્ચ	LA	B	MAE		
¥	ЈНА	•	DHA	3	VA	3	RAE		
Ŋ	NYA	*	NA	R	SHA	J	LAE		

All letters bear the inherent vowel a. This vowel may be silenced with \circ VIRAMA or through the use of conjuncts, to be explained below.

Note that the default forms of the letters TA and NA are not consistently differentiated in Tocharian manuscripts. However, their combinations with certain vowels and subscript consonants remain distinct, requiring the letters to be encoded separately.

4.8 Various signs

There are 4 various signs:

4.9 Numbers

There are 20 numbers:

•	ONE	5	SIX	θ	TWENTY	ક	SEVENTY
2	TWO	Ţ	SEVEN	ળ	THIRTY	Φ	EIGHTY
"	THREE	4	EIGHT	3	FORTY	•	NINETY
\$	FOUR	7	NINE	B	FIFTY	쾧	ONE HUNDRED
\mathfrak{b}	FIVE	ħ	TEN	£	SIXTY	\$	ONE THOUSAND

Numbers for "two hundred" and "three hundred" also exist, but they are transparent combinations of the digit for one hundred and the digits for multiples of one. It is possible to create them as sequences of the one hundred digit combined with virama and other digits to form those that are missing, or it is also possible to include these as independent glyphs.

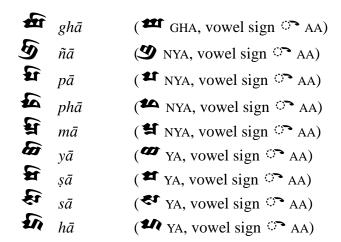

In numbers 11, 21, etc., the number $\widehat{}$ ONE always stacks vertically, appearing above of the previous number, e.g. $\widehat{}$ 91. As this only occurs with ONE, all other numbers being formed horizontally, e.g. $\widehat{}$ 92, it is best handled at the font level.

4.10 Vowel signs (matras)

Each vowel letter has a corresponding vowel sign. Vowel signs can be found above, below, or to the right of the consonant letter. Vowel signs that appear below the letter often initiate changes in the vowel sign, the consonant letter, or both. The vowel signs AA, U, and UU also takes on several contextual forms, and the consonant letter LA takes on irregular forms.

4.10.1 Contextual forms of vowel signs

- AA The vowel sign AA has various contextual forms, outlined below:
- 1 When combined with open-topped consonants and certain others:

2 A smaller variant occurs with certain round-topped letters:

```
khā(\& KHA, vowel sign \bigcirc AA)fg\bar{a}(^{\circ} GA, vowel sign \bigcirc AA)fdh\bar{a}(^{\circ} DHA, vowel sign \bigcirc AA)f\dot{s}\bar{a}(^{\circ} SHA, vowel sign \bigcirc AA)
```

3. A tall superscript form also appears with certain letters:

```
\dot{n}\bar{a} (\stackrel{\triangleright}{\sim} NGA, vowel sign \stackrel{\triangleright}{\sim} AA)

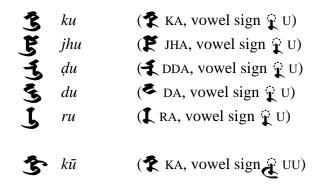

\dot{j}\bar{a} (\stackrel{\triangleright}{\sim} JA, vowel sign \stackrel{\triangleright}{\sim} AA)

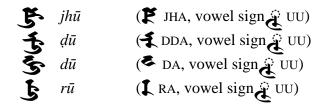

\dot{t}\bar{a} (\stackrel{\triangleright}{\sim} TTA, vowel sign \stackrel{\triangleright}{\sim} AA)

\dot{n}\bar{a} (\stackrel{\triangleright}{\sim} NNA, vowel sign \stackrel{\triangleright}{\sim} AA)
```

U/UU The vowel signs ? U and ? UU have three contextual variations, outlined below:

1. They both take a distinct form on letters that already have descenders that resemble ♀ U. This form also appears on ► DA:

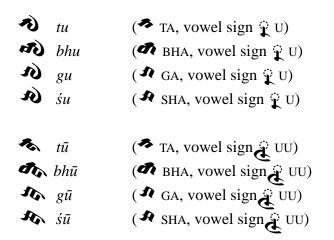

2. The second form is similar to the first, and only occurs with subscript \(\mathbb{I} \) RA:

```
y pra (⁴ PA, 【 RA)

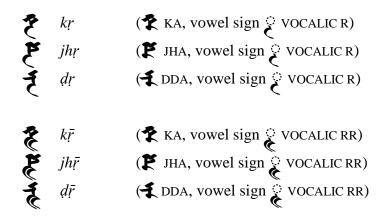

y pru (⁴ PA, 【 RA, vowel sign ♀ U)

y prū (⁴ PA, 【 RA, vowel sign ♀ UU)
```

3. Forms superficially resembling the independent vowels **(a)** O and **(b)** AU appear in combination with certain letters:

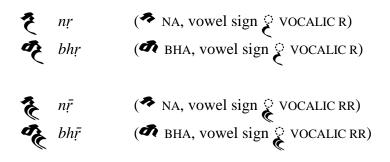

VOCALIC R AND RR Similar to the vowels U and UU, when these signs attach to a consonant with a descender, it is deleted:

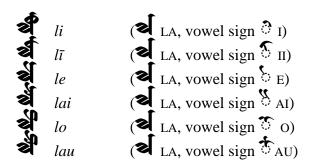

Note that these do not occur with I RA.

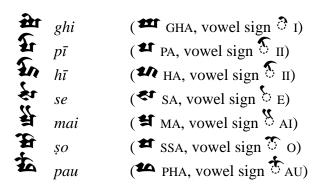

They also cause minor variation in the forms of * NA. and A BHA:

LA The consonant letter LA induces a number of irregular vowel sign forms:

I/II/E/AI/O/AU On open topped letters, these vowel signs appear one ascender to the left of the right ascender. In the case of AI, the two elements of the vowel sign appear on different ascenders. Examples:

4.11 Conjuncts

Subscripts are employed to indicate consonant clusters. Most subscripts are relatively

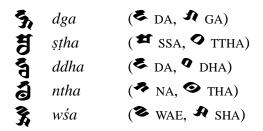

transparent and easily identifiable. There are nevertheless some subscripts that differ to a greater or lesser degree from their base forms.

Conjuncts typically comprise between 2 and 4 consonant letters, though there is theoretically no limit:

4.11.1 Variation in subscript glyph shapes

YA and I RA form subscripts that are entirely dissimilar to their base forms, while VA is also slightly different:

Several other letters gain a supporting bar in subscript form by which they attach to the base letter:

All subscripts with head-like serif element lose it in subscript form:

The position of subscripts in relation to the base consonants to which they attach is entirely dependent on the specific characters involved. Every base and subscript form has an invariable connection point used in the formation of conjuncts. As a result, some subscripts appear directly below the base, while others appear partially or almost fully to the right:

This invariable positioning has consequences for subscript YA, as it typically extends somewhat above the base of the glyph to which it is attached. When the location of the connection point of the base glyph makes this impossible, the height of subscript YA is truncated. Compare its length and height in the following conjuncts:

The conjunct *kka* employs an abbreviated form of the subscript:

Tocharian has one letter, ** tsa*, which appears frequently and could also be classified as an akhand. It is noteworthy that in this particular conjunct, ** TA has a combining form resembling that of ** NA. This likely arises from ** tsa* appearing frequently, and NA having the simpler combining form (see 4.11.2 for discussion of the subscript forms of TA and NA).

4.11.2 Variation in base glyph shapes

Conjuncts can also initiate changes in the form of the base consonant. This is most noticeable in the base conjunct forms of consonant letters with descenders. Just as they lose their descenders when combining with subscript vowel signs, so do they lose them in consonant conjuncts, e.g.:

This also occurs with the letter **1** RA, but with an important difference: namely, that it acts as a typical repha. The form of RA appears above the writing line and attaches to the full base form of a letter:

All vowel signs aside from those that attach to the bottom of consonants must attach to the repha:

The letter LA has an irregular form when it combines with repha RA:

Repha does not occur with YA; instead, a regular conjunct is formed:

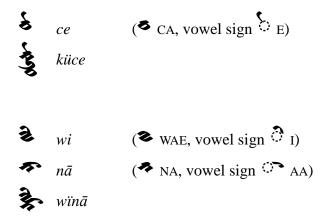

The letters • TA and • NA have unique alterations in shape. The alteration in the base form can differentiate the two letters:

This is not always a reliable guide, however, as TA occasionally resembles the combining form of NA:

As mentioned in 4.11.10, this may best be handled as an akhand ligature.

4.11.3 Aksara conjuncts

Unusually, two consonant signs, each bearing its own a vowel sign, can be combined into a single conjunct. This is most commonly found with the sequence ku, which represents the Tocharian consonant k^{w} , but it also occurs for metrical rather than phonological reasons (Hitch 2012: 282) (see Figure 5 i, j, k). Examples:

As can be seen, the vowel sign from the subscripted aksara is moved to a more convenient location.

4.12 Virama

There is 1 virama:

Tocharian employs a form of the virama that functions exactly as viramas in other Indic scripts. However, it also employs a second, far more commonly-occurring form of virama that appears visually as a horizontal or diagonal bar that precedes the marked letter or conjunct and connects it with the preceding, vowel-bearing letter or conjunct. The distinction between the two virama is mostly context-based, as, typically, *Fremdzeichen* take the bar virama while standard letters take the standard virama, though there are some exceptions (see Figure 8).

Example:

This also occurs with final consonant clusters that include a *Fremdzeichen*:

It is important to note that the bar virama can attach to any portion of the previous aksara, including the base consonant, subscript, or vowel sign.

Occasionally, a consonant may bear a redundant standard virama in addition to the bar virama:

This is, however, optional; the redundant standard virama is typically absent.

The bar virama should be treated as an alternate form of the standard virama. Though it appears before the letter it modifies, this is common in Brahmic scripts (cf. vowel signs in Devanagari, Thai, etc.). Bar virama is the standard form used with *Fremdzeichen*, while the standard virama appears on regular consonants. The exception to this are the letters CA and NYA, which lack *Fremdzeichen* variants.

Occasionally, the vowel sign is AE will appear on a letter carrying a bar virama:

This is largely restricted to A and NyA, but does occur on some other letters as well:

The proposed implementation is:

- Fremdzeichen with virama: virama is realized as bar virama
- Fremdzeichen with two viramas: first virama is realized as bar virama, second as standard virama
- standard consonant with virama: virama is realized as standard virama
- standard consonant with virama and vowel sign AE: virama is realized as bar virama.

4.13 Subscript Independent Vowel Letters

In distinct contrast to most Brahmic scripts (but with precedent in e.g. Khmer), Tocharian indicates some diphthongs through the use of subscript independent vowel signs, which are also necessarily marked with virama (see Figure 8 e, f, g, h).

If the base letter has a subscript, the virama is straight and attaches to the subscript. If it does not, the virama angles up to attach to the base consonant. Examples:

Notice that the subscript **%** I takes a different form.

4.14 Nasalization

The languages do not have nasalization *per se*, but the script nevertheless employ *anusvāra* both for nasal consonants and for transcription of Sanskrit nasalization. It appears immediately above the base consonant letter.

4.15 Aspiration

To charian employs three signs for aspiration: the *visarga* sign, which appears to the right of the base consonant sign, and the $jihv\bar{a}m\bar{u}l\bar{i}ya$ and $upadhm\bar{a}n\bar{i}ya$, which respectively indicate velar and labial allophones of h. These differ from visarga in that they act as letters and form conjuncts with the preceding consonant letter.

In Tocharian texts, VISARGA is relatively common, but JIHVAMULIYA and UPADHMANIYA are exceedingly rare.

4.16 Punctuation

There are four punctuation marks:

Danda
 Double danda
 Punctuation dot
 Punctuation double dot

5 Character properties

Tocharian character properties are as follows:

ISO/IEC JTC 1/SC 2/WG 2 PROPOSAL SUMMARY FORM TO ACCOMPANY SUBMISSIONS FOR ADDITIONS TO THE REPERTOIRE OF ISO/IEC 10646.¹.

Please fill all the sections A, B and C below.

 $\label{eq:Please read Principles and Procedures Document (P & P) from $$ \underline{$http://std.dkuug.dk/JTC1/SC2/WG2/docs/principles.html}$$ and details before filling this form.}$$

Please ensure you are using the latest Form from http://std.dkuug.dk/JTC1/SC2/WG2/docs/summaryform.html. See also http://std.dkuug.dk/JTC1/SC2/WG2/docs/summaryform.html. See also http://std.dkuug.dk/JTC1/SC2/WG2/docs/summaryform.html. See also http://std.dkuug.dk/JTC1/SC2/WG2/docs/roadmaps.html for latest Roadmaps.

A. Administrative Preliminary Proposal to Encode the Tocharian Script 1. **Title:** 2. Requester's name: Lee Wilson (ttlwilson@hotmail.com) 3. Requester type (Member body/Liaison/Individual contribution): Individual contribution 4. Submission date: 5. Requester's reference (if applicable): 6. Choose one of the following: This is a complete proposal: (or) More information will be provided later: B. Technical – General 1. Choose one of the following: a. This proposal is for a new script (set of characters): Proposed name of script: b. The proposal is for addition of character(s) to an existing block: Name of the existing block: 2. Number of characters in proposal: 3. Proposed category (select one from below - see section 2.2 of P&P document): B.1-Specialized (small collection) B.2-Specialized (large collection) A-Contemporary C-Major extinct X D-Attested extinct F-Archaic Hieroglyphic or Ideographic E-Minor extinct G-Obscure or questionable usage symbols 4. Is a repertoire including character names provided? a. If YES, are the names in accordance with the "character naming guidelines" in Annex L of P&P document? b. Are the character shapes attached in a legible form suitable for review? 5. Fonts related: a. Who will provide the appropriate computerized font to the Project Editor of 10646 for publishing the standard? Lee Wilson (TrueType or OpenType format) b. Identify the party granting a license for use of the font by the editors (include address, e-mail, ftp-site, etc.): Lee Wilson (ttlwilson@hotmail.com) 6. References: a. Are references (to other character sets, dictionaries, descriptive texts etc.) provided? b. Are published examples of use (such as samples from newspapers, magazines, or other sources) of proposed characters attached? No 7. Special encoding issues: Does the proposal address other aspects of character data processing (if applicable) such as input, presentation, sorting, searching, indexing, transliteration etc. (if yes please enclose information)?

8. Additional Information:

Submitters are invited to provide any additional information about Properties of the proposed Character(s) or Script that will assist in correct understanding of and correct linguistic processing of the proposed character(s) or script. Examples of such properties are: Casing information, Numeric information, Currency information, Display behaviour information such as line breaks, widths etc., Combining behaviour, Spacing behaviour, Directional behaviour, Default Collation behaviour, relevance in Mark Up contexts, Compatibility equivalence and other Unicode normalization related information. See the Unicode standard at http://www.unicode.org for such information on other scripts. Also see Unicode Character Database (http://www.unicode.org/reports/tr44/) and associated Unicode Technical Reports for information needed for consideration by the Unicode Technical Committee for inclusion in the Unicode Standard.

¹ Form number: N4502-F (Original 1994-10-14; Revised 1995-01, 1995-04, 1996-04, 1996-08, 1999-03, 2001-05, 2001-09, 2003-11, 2005-01, 2005-09, 2005-10, 2007-03, 2008-05, 2009-11, 2011-03, 2012-01)

C. Technical - Justification

1. Has this proposal for addition of character(s) been submitted before?	No
If YES explain	
2. Has contact been made to members of the user community (for example: National Body,	
user groups of the script or characters, other experts, etc.)?	n/a
If YES, with whom?	
If YES, available relevant documents:	
3. Information on the user community for the proposed characters (for example:	
size, demographics, information technology use, or publishing use) is included?	extinct
Reference:	
4. The context of use for the proposed characters (type of use; common or rare)	rare
Reference:	
5. Are the proposed characters in current use by the user community?	No
If YES, where? Reference:	
6. After giving due considerations to the principles in the P&P document must the proposed characters be enti-	rely
in the BMP?	
If YES, is a rationale provided?	
If YES, reference:	
7. Should the proposed characters be kept together in a contiguous range (rather than being scattered)?	Yes
8. Can any of the proposed characters be considered a presentation form of an existing	
character or character sequence?	No
If YES, is a rationale for its inclusion provided?	
If YES, reference:	
9. Can any of the proposed characters be encoded using a composed character sequence of either	
existing characters or other proposed characters?	No
If YES, is a rationale for its inclusion provided?	
If YES, reference:	
10. Can any of the proposed character(s) be considered to be similar (in appearance or function)	
to, or could be confused with, an existing character?	No
If YES, is a rationale for its inclusion provided?	
If VEC reference:	
11. Does the proposal include use of combining characters and/or use of composite sequences?	Yes
If YES, is a rationale for such use provided?	Yes
If YES, reference: Combining signs	
Is a list of composite sequences and their corresponding glyph images (graphic symbols) provided?	No
If YES, reference:	
12. Does the proposal contain characters with any special properties such as	
control function or similar semantics?	Yes
If YES, describe in detail (include attachment if necessary)	Virama
see proposal for details	
13. Does the proposal contain any Ideographic compatibility characters?	No
If YES, are the equivalent corresponding unified ideographic characters identified?	
If YES, reference:
